Civil infrastructure is the glue that holds our communities and, ultimately, our nation together. From the National Road between Cumberland, W.Va., and Vandalia, Mo., completed in 1839, to the newest stretch of the Eisenhower Interstate System, our highways help connect towns and cities across the country. And within and between these communities, streets, bridges, buildings, levees, reservoirs and water systems create the critical infrastructural framework for society to function.

At K-State civil engineering, we are delighted to educate tomorrow’s civil engineers and develop research-based innovative solutions to meet current and future infrastructure challenges. Our students, faculty, staff, advisory council and alumni work together to realize our vision of excellence in teaching, research and service activities associated with a nationally recognized civil engineering program.

It is a pleasure to present to you the 2012 annual report of the department of civil engineering at Kansas State University. In its 105th year since establishment in 1907, the civil engineering department enrolled 305 undergraduate and 71 graduate students, and awarded 47 B.S. and 29 M.S. degrees in 2012. Forty-nine undergraduate students received university or college scholarships worth more than $120,000 and 68% of students sitting in the Fundamentals of Engineering examination in fall 2012 passed the test; the national average was 64%.

The KSU steel bridge team ranked number one in the regionals and qualified for its eighth consecutive appearance at nationals.

The CE faculty includes 14 full-time professors and two instructors. As you will read in this report, all faculty members are active in research, most are licensed professionals, several serve on journal editorial boards, five are fellows of ASCE and four hold endowed professorships. In 2012, the department faculty had active projects worth more than $11.3 million and annual expenditures exceeding $2.3 million. CE faculty members have cumulatively authored more than 450 journal articles and, in 2012, they taught more than 7,000 student credit hours of undergraduate and graduate courses.

In this annual report, you will find information about activities related to the Civil Infrastructure Systems Laboratory, University Transportation Center, Mid-America Transportation Center, and CE undergraduate and graduate programs.

I invite you to read the entire report, and visit our website at www.ce.ksu.edu to learn more about our department and programs.

Robert W. Stokes, Ph.D., F.ASCE
Interim Department Head
Civil Engineering
Director, Kansas State University Transportation Center
Teaching: Environmental engineering fundamentals, water and wastewater engineering, water treatment processes, environmental chemistry
Research: Environmental fate of pollutants in natural and engineered water systems; improved, cost-effective and sustainable methods of treating drinking water; wastewater, storm water and contaminated groundwater

Sunanda Dissanayake, P.E.
Ph.D., University of South Florida, 1999
M.S., Asian Institute of Technology, 1993
B.S., University of Moratuwa, Sri Lanka, 1990
Research: Traffic engineering, traffic control systems, modeling and simulation of transportation systems to improve safety in urban and rural highways
Teaching: Route location and design, travel-demand modeling, transportation safety

Asad Esmaili, P.E.
Ph.D., University of Southern California, 2001
M.S., University of Southern California, 1998
B.S., Tehran University, Iran, 1987
Research: Smart bridge systems, feature-based structural damage detection, analytical performance of confined concrete models
Teaching: Structural engineering in concrete, advanced reinforced concrete theory, structural dynamics

Susan Gerth, P.E.
M.S., Kansas State University, 1982
B.S., University of Wisconsin-Platteville, 1978
Teaching: Strength of materials, statics and dynamics

Mustaque Hossain, P.E., FASCE
Ph.D., Arizona State University, 1990
M.S., Bangladesh University of Engineering and Technology, Bangladesh, 1986
B.S., Bangladesh University of Engineering and Technology, Bangladesh, 1983
Research: Highway materials, pavement design, pavement performance evaluation, non-destructive testing of pavements
Teaching: Engineering assembly, civil engineering materials, pavement design, sustainable transportation asset management

Alexander P. Mathews, P.E.
Ph.D., University of Michigan, 1975
M.S., University of Rhode Island, 1968
B.S., University of Madras, India, 1966
Research: Physicochemical processes including adsorption, coagulation and filtration for the treatment of water, wastewater, sludges and hazardous waste; biological waste treatment; fermentation by-products from wastes and renewable resources
Teaching: Environmental engineering fundamentals, water and wastewater engineering, water treatment processes, environmental chemistry

Ryan McGrath, P.E.
M.S., University of Colorado-Boulder, 2000
B.S., University of Hawaii, 1995
Teaching: Elementary surveying, soil and foundation construction, advance surveying and civil design, water resources engineering

Hani G. Melhem, P.E., FASCE
Ph.D., University of Pittsburgh, 1989
M.S., University of Pittsburgh, 1987
B.S., Cairo University, Egypt, 1981
Research: Artificial intelligence and information systems, computer-controlled testing, experimental analysis, fatigue and fracture of structures, finite-element and numerical modeling of structures
Teaching: Statics, structural engineering in steel, civil engineering project, advanced mechanics of materials and applied elasticity

Natalie Mladenov
Ph.D., University of Colorado-Boulder, 2004
M.S., University of Colorado-Boulder, 1999
B.S., University of South Florida, 1995
Research: Surface and groundwater quality, natural organic matter reactivity and metal interactions, fluorescence and UV-absorbance spectroscopy, organic aerosols
Teaching: Environmental engineering fundamentals, sustainable water and sanitation systems, wastewater engineering: biological processes

Yacoub Najjar, P.E.
Ph.D., University of Oklahoma, 1990
M.S., University of Oklahoma, 1986
B.S., Yarmouk University, Jordan, 1983
Research: Application of artificial neural networks and computational mechanics to civil infrastructure, interaction of soil and civil structures, geomechanics, geosynthetics and geoenvironmental systems
Teaching: Foundation engineering, design with geosynthetics, neural networks in civil engineering

Dunja Perić
Ph.D., University of Colorado-Boulder, 1990
M.S., University of Colorado-Boulder, 1988
B.S., University of Zagreb, Croatia, 1981
Research: Experimental and computational modeling of localized deformation, failure and instabilities of geomaterials; development of sustainable reinforcement systems for civil infrastructure materials
Teaching: Soil mechanics, ABAQUS applications in geosystems

Robert J. Petersman, P.E.
Ph.D., Purdue University, 1996
M.S., Purdue University, 1989
B.S., Lafayette College, 1987
Research: Behavior of prestressed concrete structures, experimental testing of concrete materials, durability of bridge decks and time-dependent deformation in structures
Teaching: Mechanics of materials, prestressed concrete design
Putting a footprint on the K-State Olathe campus

K-State Olathe, which officially opened April 26, 2011, as the newest member of the Kansas State University system, recently hosted an inaugural one and one-half day civil engineering workshop. The event, conceived by CE Professor Mustaque Hossain, was sponsored by the Mid-America Transportation Center (MATC), the Region 7 University Transportation Center of the U.S. Department of Transportation. K-State is a member of the MATC consortium, which is led by the University of Nebraska, Lincoln. CE doctoral student, Brandon Bortz (CE B.S. '08, CE M.S. '10) served as on-site coordinator.

Titled “Thin Surface Treatments for Bituminous Pavements,” the workshop was intended to educate engineers, maintenance superintendents, inspectors, technicians and other personnel involved in the implementation of thin surface treatments for pavement preservation in Kansas. The material presented covered micro-surfacing, surface recycling, chip seal and ultra-thin bonded asphalt surface (UBAS). Instruction was provided by a select group from Dustrol, Inc., Towanda, Kan.; Ergon Asphalt and Emulsion, Inc., Salina, Kan.; Road Science, LLC., Tulsa, Okla.; and Vance Brothers, Inc., Kansas City, Mo. The workshop was timely due to the recent emphasis of highway agencies in pavement preservation. It was attended by 35 engineers and other personnel from the Kansas Department of Transportation, Kansas Turnpike Authority (KTA), city of Overland Park, and the city of Hays among others.

“The class was excellent,” commented Luke Coltrane (CE B.S. ’96), a KTA construction engineer who attended with some of his staff. “It was well put together and filled with speakers who were knowledgeable in their fields. They presented their information well and intelligently answered all facets of questions. I would recommend the class to anyone involved in the paving industry from the contracting side, a municipality or even a statewide government agency.”

Complementing the main campus in Manhattan and the College of Technology and Aviation in Salina, the Olathe campus is the academic research presence within the Kansas Bioscience Park, leveraging K-State’s broad capabilities and its many resources on the Manhattan campus. K-State Olathe is also home to the Urban Water Institute, founded by the late Alok Bhandari, former CE professor and department head.
Adding advanced testing capabilities for Superpave asphalt mixture

K-State CE has had excellent laboratories facilities for asphalt since the late 1990s. The genesis of these facilities lay in the establishment of a Superpave Asphalt Laboratory by the Kansas Department of Transportation (KDOT) in 1996. The objective was to do research and training in the then newly formulated Superpave asphalt mixture design in the Strategic Highway Research Program (SHRP), a federal initiative to upgrade asphalt mixture design for the 21st century.

“The Superpave Asphalt Laboratory has been invaluable to KDOT. This facility has educated all technicians and engineers involved with KDOT Superpave asphalt mixes across the state. In addition, the research partnership between KDOT and K-State CE has benefited through numerous research projects, which permitted several improvements to the asphalt specifications,” said Rick Kreider, P.E. (CE B.S. ’91), chief of the bureau of materials and research of KDOT.

These laboratories have a combined area of 1,638 sq. ft. in Fielder Hall. The Superpave Asphalt Laboratory equipment includes Marshall molds and hammers, Marshall stability tester, multiple theoretical maximum specific-gravity test setups, multiple lab ovens, a rolling thin film oven, table-top and high-capacity mixers, two Pine Superpave Gyratory compactors and two binder ignition ovens. This laboratory is now used for the undergraduate CE materials class and research, sometimes in support of experiments at CISL. The Superpave Field Laboratory Technician Certification training, a four-day course offered jointly by K-State and KDOT, also makes use of this laboratory for hands-on training and performance testing. This course is intended to certify engineers, technicians and other personnel who will be involved in construction of Superpave hot-mix asphalt (HMA) pavements using quality control and quality assurance specifications in the state of Kansas. The course is required for all KDOT and contractor personnel performing tests on Superpave projects. Instruction is provided by a select group of instructors from KDOT, HMA industry and K-State. The successful program in 2012 brought the total number of participants completing this training since 1997 close to 1,500.

In 2000, the Kansas Asphalt Pavement Association (KAPA), under the leadership of Jim Jones (CE B.S. ‘64), led a fund-raising drive to name the Superpave Asphalt Laboratory in the newly built Fiedler Hall and to buy advanced equipment such as the Hamburg rut tester. A separate Advanced Asphalt Laboratory was established that contained the Hamburg rut tester and a linear, kneading compactor for making slab specimens. K-State is the only agency in the state that owns a Hamburg rut tester. Liquid binder test equipment required by SHRP, a dynamic shear rheometer and a bending beam rheometer, were added to this laboratory. K-State also purchased a universal testing machine manufactured by Industrial Process Control, Melbourne, Australia, for hot-mix asphalt mixture research. K-State also owns a fatigue test setup from IPC. Since 2000, these laboratories have been used in 22 research projects funded by KDOT, state departments of transportation from Iowa, Missouri, Nebraska, New York and Missouri; and the U.S. Department of Transportation. Currently, the Advanced Asphalt Laboratory also provides Hamburg rut testing services to the asphalt industry in Kansas.

In 2012, KDOT purchased a $68,000 asphalt mixture performance tester (AMPT) for this laboratory for research on second-generation Superpave mixtures. The AMPT conducts the following three tests: (1) dynamic modulus—measures a stiffness value for the asphalt pavement mixture, an input in the AASHTO Mechanistic-Empirical Pavement Design Guide (DARWin-ME); (2) repeated load (flow number)—simulates driving a heavy vehicle repeatedly over a sample of pavement; output is the number of load cycles the pavement can tolerate until it flows; and (3) static creep (flow time)—simulates a heavy vehicle standing on a pavement specimen, much as a truck might apply steady pressure to pavement while waiting at a red light; output for this test is flow time, which is the length of time the pavement can withstand the steady pressure until flow occurs.

In 2012, K-State purchased an additional $15,000 to upgrade the AMPT to do other advanced tests such as the Texas overlay and NCSU direct-tension fatigue tests. A research project using these tests to develop more durable Superpave mixtures in Kansas has been approved by KDOT and is waiting budget approval.

Engineering Education and Professional Practice

Transportation and Materials Engineering

Urban Water Institute

The Kansas State University Urban Water Institute, Professor Aklok Bhandari, founding director, is now headed by biological and agricultural engineering professor, Stacey Hutchinson. The institute is physically located on the Olathe campus of K-State and interacts closely with faculty on the Manhattan campus.

Water has been identified as one of the most critical resources for the state of Kansas, the Kansas City metro area, the nation and indeed the globe. The National Academy of Engineering has identified 14 grand challenges for the 21st century. Water plays a key role in three of these—providing access to clean water, restoring and improving urban infrastructure, and managing the nitrogen cycle. Several of the United Nation’s Millennium Development Goals are directly or indirectly tied to water quality and water quantity. These include reducing child mortality rate, improving maternal health, combating malaria and other diseases, ensuring environmental sustainability and even providing active universal primary education.

The Urban Water Institute’s location on the Olathe campus is ideal as the Kansas City metropolitan area is home to a variety of world-renowned agencies, businesses and organizations that focus on water. The U.S. EPA Region 7 office located in Kansas City, Kan., focuses on protecting and improving water quality across America’s greatest watershed, the Missouri-Mississippi Basin. Major international water-related businesses including consulting firms, equipment manufacturers and testing service providers call the Kansas City metro area their home. By being strategically located on the Olathe campus, the Urban Water Institute will help connect the water industry in the KC region with more than 50 water experts and affiliates at Kansas State University’s Manhattan campus. Assistant Professor Natalie Mladenov, Associate Professor Steve Starrett and Professor David Steward, all CE, serve among the institute’s core faculty, and Steward also serves on the institute’s faculty advisory committee.

The vision of the Urban Water Institute is to be a premier center of knowledge and outreach focused on sustainable water management in urban environments. Its mission is to advance and promote public policy, water management approaches, and treatment technologies that support sustainable water use in urban and urbanizing communities. With its relationship with Kansas State University, the Urban Water Institute is part of the 2025 plan for the university—to be recognized as one of the nation’s top 50 public research universities.

The K-State Urban Water Institute is supported by four KSU colleges—the College of Engineering, College of Arts and Sciences, College of Agriculture, and College of Architecture, Planning and Design. The institute recently launched its website: www.k-state.edu/urbanwaterinstitute.

Civil Infrastructure System Laboratory

The Civil Infrastructure System Laboratory (CISL) is a unique facility operated by the civil engineering department at K-State. The mission of the laboratory is to test civil infrastructure elements under full-scale loading. The main indoor part of the facility is for accelerating pavement testing (APT) and for calibrating falling-weight deflectometer (FWD) (now defunct). The outdoor part includes apparatus for load testing of full-scale bridge members, and an area for conducting concrete strength and durability tests under real-world environmental conditions.

The APT load assembly consists of a test frame in which a bogie with dual wheels can move forward and backward while a load is applied hydraulically (reacting against two main longitudinal girders). Tests can be conducted on three, 20-ft long and 16-ft wide test pits that can accommodate asphalt or concrete pavements. Lateral traffic wander can be applied in 0.5-inch increments, to a maximum wander of ± 6 inches, to simulate actual highway truck traffic distribution on the lane. The temperature of the pavement can be controlled within the range of –10°F to 140°F. The wheel assembly consists of a single or tandem axle with airbag suspension. The wheel assembly is an actual bogie from a standard truck. Loading of the axle is achieved by varying hydraulic pressure. At the end of the 20-ft travel, an energy absorption and release system transforms the kinetic energy of the carriage into potential energy in the springs. Compressed springs are used to launch the bogie in the opposite direction. It is also possible to achieve simulated one-way traffic using a hydraulic pump that can lift the wheels off the pavement surface after travel in one direction is completed.

In 2012, the work at CISL focused on conducting APT on geosynthetics-reinforced bases with varying base and asphalt layer thicknesses. This research project is being sponsored by Tencate Geo-synthetics of the Netherlands. Full-scale testing was done on four lanes of pavement test sections to evaluate structural effects of

University Transportation Center

While only about 40 percent of all vehicle miles are traveled on the four million miles of rural roadways in the United States, nearly 60 percent of the traffic accident fatalities occur on these roads. When adjusted for miles traveled, this fatality rate is nearly 2.5 times greater than that from accidents on urban roads. With longer driver response times due to a rural lifestyle, the likelihood of more severe crashes and a higher probability of rollovers, rural transportation safety is a national concern. The deteriorating rural transportation infrastructure and an aging rural population have further compounded the issues related to safety of rural transportation systems.

The need for a safer rural transportation system under resource-limited conditions requires innovative approaches that consider the sustainability of rural economies and communities; transportation resources will have to go further and do more than ever before. Rural transportation systems not only support motorists and rail traffic, but also continue to carry the majority of the nation’s food supply. Thus, the safety and security of the nation’s food supply is also influenced by the integrity of the rural transportation infrastructure.

Housed in the department of civil engineering, the K-State University Transportation Center (UTC) facilitates research, education and outreach associated with the sustainability and safety of rural transportation systems and infrastructure. The K-State UTC is one of 60 federally funded UTCs in the U.S. established under the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users enacted in 2005. As a Tier II Center, the K-State UTC receives approximately $450,000 of federal funding each year that is supplemented by an equivalent amount of state funds through the Kansas Department of Transportation.

The K-State UTC supports rural transportation system research by providing scholarships, graduate research assistantships, tuition, travel support and research funds to faculty in civil engineering, as well as electrical engineering, industrial engineering and economics. Since its establishment in 2006, the UTC has secured and distributed more than 2.3 million dollars in research funding that has supported 30 research projects beyond those funded by the K-TRAN program. The center has awarded 45 scholarships and 45 graduate research assistantships.

Professor Robert Stokes has served as the director of the K-State UTC since 2008. In 2012, the center hosted the 95th Annual Kansas Transportation Engineering conference that attracted more than 500 participants. Graduate student Brandon Bortz was named the student of the year and was recognized for this achievement at the Transportation Research Board annual meeting in Washington D.C.

Mid-America Transportation Center

K-State CE is a partner in the Mid-America Transportation Center (MATIC), a Region 7 University Transportation Center of the U.S. Department of Transportation. The center is a consortium of five universities – the University of Nebraska-Lincoln, Kansas State University, the University of Kansas, Missouri University of Science and Technology, and the University of Iowa. In 2012, Iowa State University and the University of Missouri also joined this consortium. MATC projects at K-State are administered by Professor Mustaque Hossain who serves as an associate director of the center.

K-State MATC work concentrates on the preservation and safety of our regional transportation infrastructure due to increased truck loads resulting from freight movements. The USDOT strategic goals of “state of good repair” and “safety” were the predominant goals. Professor Sunanda Dissanayake worked on safety and Professors Hossain and Peterman worked, respectively, on pavements and structural issues. Professor Peterman continued his work on railroads. Professor Kyle Riding has started as a new investigator. His project is on durable concrete pavement repair materials. Professor Ken Khalufi from the department of chemistry has teamed up with Iowa State University to derive asphalt binder additives from bio-fuel production wastes. That project delves into “environmental sustainability” and “economic competitiveness” strategic goals of USDOT.

Several presentations were based on the MATC-sponsored research projects. Professor Dissanayake presented a paper titled “Identification of Characteristics and Severity Analysis of Large Truck Crashes Using Binary Logit Model” at the Mid-Continent Transportation Research Forum, Sept. 6–7, 2012, Madison, Wisconsin. The paper was also published in the proceedings. MATC-supported graduate student Nassim Sabahi is scheduled to present her master’s research at the 2013 ASCE Highway and Airfield Pavement Conference in June in Los Angeles, Calif.

A number of graduate students supported by MATC have received their degrees. Two students have received their master’s degrees and one has received a Ph.D. degree. One of the master’s graduates has continued her doctoral studies at K-State. MATC-KSU has also supported a number of summer and academic year interns. A new minority internship program has also been started. The MATC technology transfer projects at K-State were very successful as well. MATC was a sponsor of the Annual Kansas Transportation Engineering Conference in April 2012, which was very well attended. Three four–day Superpave training classes, in February and March of 2012, were also offered by K-State. These certificate classes had about 61 participants. A two-day workshop on “Thin Surface Treatments for Bituminous Pavements” was held on the K-State Olathie campus. Thirty five state, local government and industry people participated in that event. Professors Dissanayake, Hossain and Peterman each participated in the inaugural MATC Webinar series.

Environmental Engineering

The Role of Dust on Snow and Other Aeolian Inputs in Soil Formation and Biogeochemical Cycling in Barren, Alpine Catchments

P.I.: Natalie Mladenov; Co-P.I.s: Williams, Schmidt, and Blum National Science Foundation, $536,774, 2010-2014

The combination of increasing temperatures and dust emissions, melting glaciers and surprisingly high amounts of microbial activity in recently deglaciated soils represent a new connectivity between geologic, biological and hydrologic processes in barren, alpine catchments. This project evaluates the provenance and chemical quality of aeolian deposition and investigates initial phases of weathering and biogeochemical cycling in barren, high-elevation soils using novel spectroscopic techniques, stable isotopes and chemical analyses, soil chemistry and mineralogical analyses, and bioavailability experiments. Hypotheses are being tested in the Green Lakes Four catchment of the Colorado Front Range, where aeolian deposition, soil microbial processes and nitrification, which have been studied independently over the last few decades, are being studied as interacting processes in an interdisciplinary investigation.

REU Site: Sustainable Production and Processing Systems for Biomass-Derived Fuels of the Future

P.I.: Alok Bhandari; Co-P.I.s: Raj Raman and Michelle Soupir National Science Foundation, $312,000, 2010-2013

Biomass-derived fuels are a promising source of renewable energy with a potential to reduce energy imports while decreasing atmospheric emissions of fossil-fuel derived CO₂. This project focuses on: (i) educating the next generation of scientists and engineers about biomass-derived fuel production, (ii) training them to conduct high-quality scientific research and (iii) inspiring them to pursue graduate education. The REU site is hosted at Iowa State University. Each year, 10 participants are recruited and matched with one of five specific project areas based on their academic background and interests. Students spend 10 summer weeks on campus working on hypothesis-driven project topics contributed by nine faculty researchers who closely mentor and supervise each student’s research. Other enrichment activities include technical and professional seminars, field trips, attendance at an international conference, group meetings and work sessions, and a five-hour ethics workshop. Project success is measured through qualitative and quantitative assessments conducted by the PI-in collaboration with specialists in education research.

Enhanced Gas-Liquid Mass Transfer Using Magnetic Nanoparticles

Nanoparticles and mesoporous nanoshells possess unique properties such as high surface area and mobility, and these can be used to advantage in changing bubble properties in gas-liquid mass transfer. This project investigates methods and mechanisms to enhance gas-liquid mass transfer and reaction rates using nanoparticles and nanoshells as shuttles. This process can provide a several-fold increase in mass transfer rates due to (1) a parallel liquid-solid-gas transfer mechanism in addition to liquid-gas mass transfer, (2) increased bubble residence time and (3) cavitating bubbles under ultrasonic fields. The project is examining the mechanisms by which inert and adsorbed nanoparticles affect mass transfer rates in the transfer of dissolved organic contaminants from water to the air phase in the presence and absence of ultrasonic fields. Results of this work promise to provide more efficient means of conducting mass transfer operations in drinking water purification, multiphase reactions in the process industries, and in the removal of volatile organic compounds from contaminated ground water and wastewaters.

Geotechnical Engineering

Characterizing KDOT’s Chloride Permeability Testing Protocol: Reducing the Duration of Rapid Chloride Permeability Test

P.I.: Yacoub Najjar

KSU University Transportation Center, $90,000, 2008-2012

Reliable and economical design of Portland cement concrete (PCC) pavement structural systems relies on various factors, among which is the proper characterization of the expected permeability response of the concrete mixtures. For characterization of the permeability response of PCC pavement structure, the Kansas Department of Transportation (KDOT) uses the rapid chloride permeability test to determine the resistance of concrete to penetration of chloride ions, as well as the boil test to determine the percent of voids in hardened concrete. In this project, back propagation artificial neural network (ANN)-based and regression-based permeability response prediction models for rapid chloride and boil tests are being developed in order to reduce or eliminate the duration of the test cycle. Comparison of the predictive accuracy of the developed ANN models and regression models show that ANN models outperform the regression-based models. The ANN-based permeability prediction models being developed from this research appear to be efficient in characterizing the permeability response of concrete mixtures used in transportation applications.

Structural Engineering

P.I.: Asad Esmaeely; Co-P.I.: Hayden Rasherd

Kansas Department of Transportation, $59,240, 2010-2012

State DOTs are expected to use the new AASHOT LRFD bridge design code. This project addresses K-DOT’s need and provides the analytical tools necessary for a realistic performance assessment of bridge piers under various loading conditions. A displacement-controlled analysis procedure is used for performance assessment. Virtual analysis is conducted using the KSU: RC as the analytical tool to perform moment curvature and force deflection. The program has been benchmarked against experimental data from a number of reinforced concrete bridge columns under a wide range of loading patterns, including non-proportional axial load and cyclic lateral displacement.

FRP Bridge Deck Panels

P.I.: Hani Melhem

KSU University Transportation Center, $36,500, 2010-2012

AASHTO provides load distribution factors for determining how much load a longitudinal beam supporting a bridge deck should be designed to hold. Since fiber-reinforced polymer (FRP) is a relatively new material used for bridge design, there are no provisions in the AASHTO specifications that provide a load distribution when designing beams supporting an FRP deck. In this project, FRP honeycomb, or FRPH, hollow-core deck panels, are being loaded and analyzed to provide information about a conservative load distribution that will assist engineers in future bridge designs with FRPH decks. Two support conditions are being evaluated: continuous panel supported by four beams and a simply supported panel with cantilever on one side. Strain gauges are mounted at mid-span of each beam. Conservative design factors are being determined through data analysis for the FRPH deck.

EAGER: Engineered Bio-Composites for Sustainable Concrete

P.I.: Hayden Rasherd; Co-P.I.s: Danja Petic and Larry Davis National Science Foundation, $30,000, 2010-2012

Special attention is needed for more durable construction that requires less frequent and less expensive maintenance of highway infrastructure while utilizing materials whose use is sustainable. This project investigates incorporation of agricultural wastes to enhance the behavior of concrete. Renewable agricultural waste material is abundantly available as co-products of biofuel processing. This project is determining the optimum proportions of cellulose fibers and lignin that can sustain the performance of concrete under short-term loading. Lignin acts as a water reducer to control the water-cement ratio and improve strength and durability. Wheat fiber, on the other hand, acts as a micro-cracking barrier controlling the microstructure crack growth under early age and fatigue conditions. This project is focused on combining both bio-based materials in reinforcing cement concrete.

Transportation and Materials Engineering

Effects of Geometric Design Features on Truck Crashes on Limited-Access Highways

P.I.: Sunanda Dissanayake

Mid-America Transportation Center, $54,601, 2010-2012

Greater amounts of freight are being transported by trucks, causing the number and percentage of trucks on the national highway system to increase significantly. Trucks are larger in size and weight and typically have different performance characteristics than passenger vehicles. Safe operation of these large trucks is a major concern as they disproportionately account for traffic fatalities. When trucks are involved in crashes with other smaller vehicles, the majority of fatalities involve the occupants of the trucks.
other motor vehicle. A better understanding of the impact of geometric design features of highways on truck crashes can bring significant benefits. This project evaluates truck crashes in detail by developing models to determine the influence of various geometric design features, traffic and other characteristics of large-truck crash occurrence on limited-access roadways.

KSU University Transportation Center
P.I.: Robert Stokes
U.S. Department of Transportation, $198,229, 2010-2012

The goal of this project is to recruit and retain highly qualified students in programs of study that advance the mission of the K-State UTC. Project funds are also used to provide travel assistance for students to participate in conferences and workshops. Candidates for the UTC Scholarship and Assistantship Program are nominated by a member of the UTC faculty. The scholarship and assistantship awards are typically on the order $5,000/semester, depending on availability of funds.

A Review of K-DOT Overhead Guide Sign Lighting Policy
P.I.: Margaret Rys; Co-P.I.s: Andre Rys and Eugene Russell
Kansas Department of Transportation, $89,000, 2010-2012

The goal of this project is to determine the minimum retro-reflectivity levels for the overhead guide signs that will satisfy FHWA requirements and be consistent with minimizing life-cycle costs. It includes a study of the cost and safety benefits of using different retro-reflective sheeting versus external lighting for the overhead guide signs, and the most cost-effective means of external illumination considering the life-cycle costs of newer, lower energy systems.

P.I.: Mustaqeem Hossain; Co-P.I.: Dean Testa
U.S. Department of Transportation, $129,967, 2008-2012

Current seal and coat design methods used for preservation of asphalt pavements were designed for regular aggregates. K-DOT exclusively uses lightweight aggregates for asphalt pavement design. There have been recent problems in Kansas and lightweight aggregates have been blamed for these. Almost no information is available on seal coats with lightweight aggregates, necessitating the investigation for lightweight aggregates. This project includes the development of a one-day training class and a seal coat design manual for KDOT, and evaluation of the use of lightweight aggregates in chip seal in Kansas.

BRIGE: Linking the Microstructure, Performance and Sustainability of Mixed-Glass Cullet-Blended Cements
P.I.: Kyle Riding
National Science Foundation, $174,999, 2010-2012

Mixed-glass cullet is most often landfilled because of the difficulty and expense in recycling heterogeneous glass particles into new container glass. This material, however, has the potential to improve concrete properties while replacing millions of tons of cement in concrete each year with a corresponding reduction in greenhouse gas emissions. This project utilizes micro-structural and thermodynamic modeling to predict the reactivity of mixed-glass cullet particles in concrete. Results from this research are providing a rational, materials science-based approach for optimizing mixed-glass cullet performance in concrete for precast applications and ultra-high performance concrete, which are usually cured at varying and elevated temperatures.

Water Resources Engineering
Hyper-Extractive Economies and Sustainability: Policy Scenarios for Sustainable Water Use in the High Plains Aquifer
P.I.: David Steward; Co-P.I.s: Joseph Aistrup, Laszlo Kulcsar, Jeffery Peterson, Steve Welch
National Science Foundation, $1,499,000, 2009-2012

Southwest Kansas sits on the Ogallala Aquifer, one of the world's largest underground sources of freshwater, which is also quickly becoming a depleted natural resource. Hyper-extractive practices produce economic and resource path dependencies, which when placed in relation with global processes such as international migration and the emergence of global commodity chains, shape future patterns of population growth and economic development. This project focuses on investigating changes in the parameters of irrigated agriculture that will produce sustainable uses of the aquifer without jeopardizing the region's economy. To model this system, researchers are using an integrated, cross-disciplinary, system-level theoretical approach that links land and water use patterns, economic trends and population dynamics to issues of sustainability. The project focuses on 1) accurately modeling the current hyper-extractive system; 2) forecasting the outcome of possible policy approaches to transition the current system toward possible paths that are more sustainable for the social, economic and natural systems of the groundwater-based economies of the High Plains Aquifer; and 3) communicating the model's outcomes to stakeholders and policy makers for the purpose of developing legislation to implement policy changes designed to enhance sustainability. Involvement of researchers, educators, students, elected leaders and stakeholders ensures development of a healthy dialogue about the possibility of changing policy to implement some combination of reforms to enhance regional sustainability.

Environmental Engineering
Performance and Acceptance of Denitrification Bioreactors for Agricultural Drainage
Pre-Doctoral Fellowship Grant, U.S. Department of Agriculture National Institute of Food and Agriculture, $40,000, 2011-2012 (at Iowa State U)

Occurrence and Movement of Antibiotic-Resistant Bacteria and Resistance Genes in Tile-Drained Agricultural Fields Receiving Swine Manure Application
National Pork Board, Bhandari, A.; Soupir, M.; Moorman, T. $30,000, 2011-2012 (at Iowa State U)

REU Site: Sustainable Production and Processing Systems for Biomass-Derived Fuels of the Future
National Science Foundation, Bhandari, A.; Ramam, D.R.; Soupir, M. $312,000, 2010-2013 (at Iowa State U)

REU Site: Bridging the Diversity Gap: Research Experiences in the Geosciences for Community College Students and Transfer Students
National Science Foundation, Tim, U.; Kaleta A.; and Bhandari A. National Science Foundation, $150,000, 2010-2012 (at Iowa State U)

Enhanced Gas-Liquid Mass Transfer Using Magnetite Nanoparticles
National Science Foundation, Mathews, A. P. $311,287, 2009-2012

Geotechnical Engineering
Characterizing KDOT’s Chloride Permeability Testing Protocol: Reducing the Duration of the Rapid Chloride Permeability Test
KSU University Transportation Center, Najjar, Y. $139,124, 2008-2012

The Role of Dust on Snow and Other Aerial Inputs in Soil Formation and Biogeochemical Cycling in Barren, Alpine Catchments
National Science Foundation, Mladenov, N.; Williams, Schmidt, and Blum. $556,774, 2011-2014.

International Planning Visit: Investigating the Interactions Between Dissolved Organic Matter, Microbial Communities, and Arsenic Biogeochemistry in Groundwater of a Pristine Delta
National Science Foundation, Mladenov, N. $19,943, 2011-2012.

REU Enhancement of Gas-Liquid Mass Transfer Using Magnetite Nanoparticles
National Science Foundation. Mathews, A. Awarded in 2012: $12,200.

K-State CE offers comprehensive programs leading to the degrees master of science and doctor of philosophy in civil engineering. Graduate students work with their committees to create personalized graduate programs of study in specializations such as environmental engineering, geotechnical engineering, materials engineering, structural engineering, transportation engineering and water resources engineering. An active research program is conducted in each of these areas, and it is the goal of the department to maintain a close connection among graduate study, research, teaching and engineering practice. In 2012, 71 students were enrolled in K-State CE graduate programs. Twenty-nine M.S. degrees and two Ph.D. degrees were awarded.

Students admitted for work toward an M.S. degree select a program of study requiring completion of a master’s thesis or a master’s report within their area of interest. Students supported on research projects are typically expected to complete a thesis. Students admitted for work toward a Ph.D. degree are required to develop an original research program, and complete a doctoral dissertation under the guidance of a program of study committee made up of faculty members from CE and other departments.

K-State CE also offers a graduate certificate program in transportation engineering. Graduate students majoring in any specialization can earn this certification after completing 12 credit hours of course work required for the certificate.

In the next decade, another billion people will be added to the earth’s population. This growth creates enormous demands for infrastructure to produce energy, transport people and goods, dispose wastes, clean the environment, and construct living and working spaces. Skills of civil engineers will, as always, be central to meeting these demands.

Civil engineering is the engineering of constructed facilities and systems: buildings, bridges, tunnels, dams, harbors, airports, waterways, highways, hydropower, irrigation, water supply, wastewater treatment and environmental health systems. As a rule, if a facility is one-of-a-kind, large and important in the daily lives of many people, chances are civil engineers participated in the planning, design and construction of that facility.

The K-State CE undergraduate program is fully accredited by the Engineering Accreditation Commission of the Accreditation Board of Engineering and Technology (ABET). Students enrolling in the bachelor of science program in civil engineering must successfully complete 128 credit hours of required courses in the curriculum. The CE program offers students the opportunity to pursue one of five curriculum tracks: general civil engineering, construction engineering, environmental engineering, structural engineering and transportation/materials engineering. In 2012, the department enrolled 305 students and awarded 47 B.S. degrees. CE undergraduate students received 49 scholarship awards worth $120,000.

In 2012, the department enrolled 305 students and awarded 47 B.S. degrees. CE undergraduate students received 49 scholarship awards worth $120,000.

Extracurricular opportunities include the ASCE student chapter, the Institute of Transportation Engineers student chapter, the Chi Epsilon honorary and the Women in Civil Engineering organization. Students enthusiastically participate in competition teams such as the concrete canoe and steel bridge teams. The K-State CE steel bridge team routinely ranks among the top teams in the regional competition and made its eighth consecutive appearance in the national competition in 2012. Student performance in the Fundamentals of Engineering test has been very good with our pass percentage for the October 2012 FE exam being 68%, compared to the national pass rate of 64%.

A valuable source of information about the CE graduate programs is the Graduate Handbook published by the department and accessible at the following website: www.ce.ksu.edu/grad.
The mission of the council is to provide a continuing liaison between the academic community and practicing profession, and to assist the CE department, College of Engineering and Kansas State University in providing the highest quality of civil engineering education.

Functions of the council are to review programs and goals, and advise the department head and dean of the college.

Goals and objectives of the civil engineering advisory council include the following:

- coordinating with the department to stay informed about its needs;
- consulting and assisting the department head and faculty on departmental curricula, including instructional and organizational matters;
- presenting information on needs and services of the department to interested parties;
- assisting in the collection of case studies and problem materials for educational purposes;
- assisting in the process of faculty recruitment and faculty-industry interaction;
- assisting the department in developing research and technology transfer;
- assisting with ABET accreditation; and
- providing support to students and faculty through engagement in department and classroom activities.
